

Figura 19. *Tensioni massime di trazione condizione sismica_Y (picco di scala 0.03 MPa)*

Figura 20. *Tensioni massime tangenziali condizione sismica_Y (picco di scala 0.003 MPa)*

Figura 21. *Tensioni massime di compressione condizione sismica_Y (picco di scala 0.04 MPa)*

È possibile notare come, sotto azione sismica, lo stato tensionale non è particolarmente gravoso e la capacità risulta superiore alla domanda. Quanto esposto è chiarito nei successivi grafici dove si riporta, per le diverse condizioni sismiche, l'involuppo delle tensioni massime.

Figura 22. *Comparazione tensioni principali di compressione con resistenza a compressione muratura, condizione sismica 100% X.*

Figura 23. *Comparazione tensioni principali di trazione con resistenza a compressione muratura, condizione sismica 100% X.*

Figura 24. *Comparazione tensioni principali di compressione con resistenza a compressione muratura, condizione sismica 100% Y.*

Figura 25. *Comparazione tensioni principali di trazione con resistenza a compressione muratura, condizione sismica 100% Y.*

Nel caso specifico, sotto azione sismica, la struttura non presenta particolari deficit strutturali in termini di resistenza data la geometria dei muretti che risultano mediamente bassi e con spessori elevati. Sotto tali condizioni il parametro ζ_E assume valore 2.42. Si rammenta che il parametro ζ_E è definito come il rapporto tra l'azione sismica massima sopportabile dalla struttura e l'azione sismica massima che si utilizzerebbe nel progetto di una nuova costruzione sul medesimo suolo e con le medesime caratteristiche (periodo proprio, fattore di comportamento ecc.). Il parametro di confronto dell'azione sismica da adottare per la definizione di ζ_E è, salvo casi particolari, l'accelerazione al suolo ag.

Dunque, le verifiche globali risultano soddisfatte data la modesta geometria dei paramenti murari in termini di altezza e spessori.

6.2.Stato di fatto: analisi del comportamento locale

Per la struttura in esame, allo stato di fatto, si ritiene inutile una verifica a ribaltamento essendo, l'apparecchiatura muraria, non in grado di esibire un comportamento monolitico. Infatti, la strategia di intervento è stata sviluppata, oltre che per ripristinare alcune mancanze materiche ed elidere l'evolversi del degrado dei materiali, per garantire un comportamento monolitico della struttura.

6.3.Stato di progetto: analisi del comportamento globale

Per la struttura in esame sono previsti interventi mirati al risanamento e conservazione delle opere. Le tecnologie adottate per il rinforzo strutturale rispettano i requisiti di compatibilità e di minima invasività per i siti archeologici. Le opere in progetto sono sinteticamente riportate nel seguito:

- Rimozione della vegetazione e trattamento protettivo: insieme sistematico di opere atte a rimuovere la vegetazione presente e prevenirne lo sviluppo futuro (per ulteriori info si veda descrizione 1 della tavola 14 allegata);
- Protezione delle creste murarie: previa pulizia delle superfici interessate si prevede la stuccatura di eventuali fessure e riempimento di eventuali cavità con malta di calce idraulica compatibile con l'esistente. Successivamente si provvede alla protezione della cresta muraria con un layer di pietrame (per ulteriori specifiche si veda punto 2 della tavola 14);
- Cucitura della muratura mediante sistema composito in fibra di basalto e matrice inorganica: al fine di garantire il comportamento monolitico del sistema murario è prevista una ristilatura armata con materiale composito. La corda in fibra di basalto viene inserita tra i giunti di malta e tra i due paramenti, previa foratura, e con idoneo interasse. I giunti sono infine ristilati mediante malta a base di calce idraulica. Per ulteriori specifiche si

veda il punto 3 della tavola 14, la relazione di calcolo strutturale e la relazione dei materiali allegata;

- Integrazione muraria dei paramenti murari: in corrispondenza delle mancanze rilevate nell'apparecchiatura muraria si provvede all'integrazione mediante materiale di reimpiego proveniente dallo scavo. Per ulteriori informazioni si veda la scheda 4 della tavola 14 allegata;
- Consolidamento dei conci di Pietrafavara: A seguito della rimozione della vegetazione superiore e della patina biologica, si prevede il consolidamento dei conci di Pietrafavara mediante applicazione a pennello di soluzione a base di silicato di etile. Si prevedono, inoltre, limitate rincoccature per colmare piccole mancanze o spazi al margine tra le parti in Pietrafavara e quelle in pietra calcarea. Per ulteriori informazioni si veda la scheda 5 della tavola 14 allegata;
- Sigillatura profonda dei giunti: si prevede la sigillatura in forte sottosquadro dei giunti, eseguita con malta a base di calce idraulica con composizione compatibile con quella preesistente, caratterizzata nel corso delle indagini preventivamente svolte. I giunti saranno rifiniti in forte sottosquadro rispetto ai conci e con profilo a scivolo per evitare l'accumulo di acque meteoriche. Per ulteriori informazioni si veda la scheda 6 della tavola 14 allegata;
- Colatura di malta a rifiuto: l'intervento, da realizzarsi dove il crollo del paramento esterno ha messo in luce il sacco della muratura, ha l'obiettivo di colmare vuoti discontinuità interne e assicurare una maggiore resistenza e una migliore ripartizione dei carichi. Per ulteriori specifiche si veda la scheda 7 della tavola 14;
- Rimozione del materiale di crollo e di scavo: Si prevede la ricognizione del materiale sciolto derivante da crolli o da precedenti scavi. Eventuali conci modanati o di reimpiego saranno catalogati e conservati. Si valuterà la possibilità di reimpiegare i restanti conci per interventi di reintegrazione del sacco della muratura e di protezione delle creste murarie. Per ulteriori info si rimanda alla scheda 8 della tavola 14 allegata.

Gli interventi sopra descritti sono pertanto finalizzati, oltre che ad un miglioramento delle proprietà meccaniche della muratura, al conferimento di un comportamento monolitico della stessa.

In accordo a quanto specificato al punto 8.5.3.1 della Circolare, a seguito di interventi di consolidamento, è possibile adottare coefficienti migliorativi sulle proprietà meccaniche dei materiali come riportato nella tabella seguente.

Tabella C8.5.II -Coefficienti correttivi massimi da applicarsi in presenza di: malta di caratteristiche buone; ricorsi o listature; sistematiche connessioni trasversali; consolidamento con iniezioni di malta; consolidamento con intonaco armato; ristilatura armata con connessione dei paramenti.

Tipologia di muratura	Stato di fatto			Interventi di consolidamento			
	Malta buona	Ricorsi o listature	Connessione trasversale	Iniezione di miscele leganti (*)	Intonacoarmato (**)	Ristilatura armata con connessione dei paramenti (**)	Massimo coefficiente complessivo
Muratura in pietrame disordinata (ciottoli, pietre erratiche e irregolari)	1,5	1,3	1,5	2	2,5	1,6	3,5
Muratura a conci sbazzati, con paramenti di spessore disomogeneo	1,4	1,2	1,5	1,7	2,0	1,5	3,0
Muratura in pietre a spacco con buona tessitura	1,3	1,1	1,3	1,5	1,5	1,4	2,4
Muratura irregolare di pietra tenera (tufo, calcarenite, ecc.,)	1,5	1,2	1,3	1,4	1,7	1,1	2,0
Muratura a conci regolari di pietra tenera (tufo, calcarenite, ecc.,)	1,6	-	1,2	1,2	1,5	1,2	1,8
Muratura a blocchi lapidei squadriati	1,2	-	1,2	1,2	1,2	-	1,4
Muratura in mattoni pieni e malta di calce	(***)	-	1,3 (****)	1,2	1,5	1,2	1,8
Muratura in mattoni semipieni con malta cementizia (es.: doppio UNI foratura ≤40%)	1,2	-	-	-	1,3	-	1,3

(*) I coefficienti correttivi relativi alle iniezioni di miscele leganti devono essere commisurati all'effettivo beneficio apportato alla muratura, riscontrabile con verifiche sia nella fase di esecuzione (iniettabilità) sia a-posteriori (riscontri sperimentali attraverso prove soniche o similari).

(**) Valori da ridurre convenientemente nel caso di pareti di notevole spessore (p.es. > 70 cm).

(***) Nel caso di muratura di mattoni si intende come "malta buona" una malta con resistenza media a compressione f_m superiore a 2 N/mm². In tal caso il coefficiente correttivo può essere posto pari a $f_m^{0,35}$ (f_m in N/mm²).

(****) Nel caso di muratura di mattoni si intende come muratura trasversalmente connessa quella apparecchiata a regola d'arte.

Nel caso di consolidamento con ristilatura armata e connessione dei paramenti, il coefficiente indicato in tabella, diversificato per le varie tipologie murarie, può essere applicato ai valori sia dei parametri di resistenza (f , f_0 e f_{v0}), sia dei moduli elastici (E , G), in quest'ultimo caso in misura ridotta del 50%.

I valori sopra indicati in tabella per il consolidamento delle murature devono essere considerati essenzialmente un riferimento, in assenza di specifiche valutazioni sui valori da adottare per il caso in esame; nel caso di tecniche diverse da quelle indicate nella tabella, i valori riportati costituiscono un utile riferimento. Nel caso di uso combinato di diverse tecniche di consolidamento, i coefficienti possono essere applicati in forma moltiplicativa; il valore del coefficiente complessivo non può superare il coefficiente massimo indicato nell'ultima colonna della tabella.

L'analisi strutturale, oltre a tener conto di tali incrementi di resistenza, è stata sviluppata tenendo conto dell'effettiva presenza del rinforzo. Tale assunzione è chiave per stabilire la dimensione massima della gabbia armata e dell'interasse tra le guide di ristilatura armata (figura 26). Infatti, la linea di ristilatura, in base alle caratteristiche dei materiali adottati per il rinforzo, non necessariamente deve coincidere con quella contornante il blocco di muratura.

Figura 26. *Esempio di ristilatura armata.*

Utilizzando, per la ristilatura, corde in fibra di basalto e pertanto caratterizzate da rapporto EI/l (rigidezza flessionale/lunghezza) molto basso è possibile trascurare il contributo in termini flessionali e in compressione del cordino in fibra di basalto. Pertanto, il rinforzo tende a reagire solo ed esclusivamente per sforzo normale di trazione.

Tale peculiarità di comportamento si sposa perfettamente con quanto già rilevato per lo stato di fatto. In particolare, la resistenza a compressione, può essere garantita dalla stessa muratura che, a valle dell'intervento di consolidamento, presenterà un miglioramento (in termini di resistenza a compressione). Mentre, la scarsa resistenza a trazione della muratura, viene compensata dal sistema di cucitura in fibra di basalto. I successivi istogrammi mostrano il confronto tra gli stati tensionali interni, in termini di tensioni principali di compressione, con la resistenza a compressione. Il confronto è stato eseguito per le tre condizioni di carico più gravose.

Figura 27. Confronto tensioni massime di compressione con resistenza a compressione muratura sotto condizione gravitazionale.

Figura 28. Confronto tensioni massime di compressione con resistenza a compressione muratura sotto condizione sismica, 100%Sisma_X.

Figura 29. Confronto tensioni massime di compressione con resistenza a compressione muratura sotto condizione sismica, 100%Sisma_Y.

È immediato notare come il miglioramento delle proprietà meccaniche della muratura, a seguito degli interventi, garantisca un ulteriore miglioramento della verifica a compressione della muratura per tutte le condizioni di carico.

Per quanto concerne il comportamento a trazione può essere garantito dalla presenza del rinforzo. In particolare, definita la dimensione massima della maglia ($l \times l$) pari a $40\text{cm} \times 40\text{cm}$ e l'interasse massimo dei collegamenti trasversali ($i=40\text{ cm}$), lo sforzo normale agente sulla corda in basalto (linea di giunto o collegamento trasversale) è pari all'integrale delle tensioni sull'area di influenza afferente all'elemento considerato.

In particolare, la forza massima di trazione agente sulla corda in basalto di collegamento tra i paramenti è pari all'integrale delle tensioni di trazione parallele alla direzione della corda stessa (figura 23).

Figura 30. *Distribuzione schematica delle tensioni di trazione sul collegamento in basalto tra i due paramenti.*

Analogamente è possibile calcolare la risultante agente sul cordino in basalto parallelo al giunto (figura 27).

Figura 31. *Distribuzione schematica delle tensioni di trazione sul cordino in basalto parallelo ai giunti.*

Essendo lo spessore del cordino uniforme per l'intera ingabbiatura è stato considerato, in via cautelativa, il valore di picco della tensione di trazione tra le diverse direzioni ed integrata sull'area di influenza media (40x40cm).

Pertanto, la massima trazione agente sulla corda in basalto è stata calcolata come:

$$T = \int_{A_m} \sigma_{tra.max} \cdot A_m da$$

Nella quale:

- $\sigma_{tra,max}$ rappresenta la massima tensione di trazione agente in un generico punto;
- A_m è l'area media della maglia pari a 160000 mm^2

Sviluppando quanto sopra esposto si ottiene una forza di trazione massima agente pari a 0.18 kN. Per un diametro del cordino in basalto pari a 3 mm, si ottiene una tensione agente di picco del cordino di basalto pari a 98.6 MPa. Considerando una resistenza minima del basalto pari a 1100 MPa, si ottiene infine un tasso di lavoro all'interno della fibra inferiore al 15%.

6.4.Stato di progetto: analisi del comportamento locale

La strategia di intervento adottata conferisce alla componente strutturale un comportamento senz'altro monolitico e per il quale è certamente opportuno effettuare una verifica a ribaltamento.

Quanto di seguito esposto sintetizza gli aspetti significativi dell'analisi dei cinematismi di collasso locali negli edifici esistenti in muratura. Il quadro normativo vigente indica che la valutazione della sicurezza sismica degli edifici in muratura va eseguita, oltre che con riferimento al comportamento sismico globale, anche con riferimento all'analisi dei meccanismi locali di collasso. “Quando la costruzione non manifesta un chiaro comportamento d'insieme, ma piuttosto tende a reagire al sisma come un insieme di sottosistemi (meccanismi locali), la verifica su un modello globale non ha rispondenza rispetto al suo effettivo comportamento sismico. In tali casi la verifica globale può essere effettuata attraverso un insieme esaustivo di verifiche locali.” Meccanismi di risposta di questo tipo, generalmente meno resistenti e meno duttili di quelli che coinvolgono la risposta d'insieme del fabbricato, devono quindi essere opportunamente considerati nella definizione di un modello di analisi che sia realmente rappresentativo del comportamento sismico strutturale. Il primo aspetto dell'analisi riguarda dunque il riconoscimento delle condizioni che predispongono all'attivazione di meccanismi locali di danno e collasso e quindi la valutazione della necessità di effettuare analisi cinematiche in sostituzione o in integrazione di analisi della risposta globale del sistema.

L'individuazione delle modalità di collasso significative per gli edifici si compie quindi innanzitutto attraverso la ricerca di sconnessioni, presenti o che possono formarsi nella compagine muraria a causa delle azioni sismiche, che individuano macroelementi (porzioni più o meno estese della struttura muraria che, nel caso di murature di adeguata qualità, si comportano monoliticamente) suscettibili di instabilità. I fattori condizionanti il riconoscimento di ciascun meccanismo, essenzialmente rappresentati dalle:

- Condizioni di vincolo della parete interessata dal meccanismo: sono indicate le condizioni di vincolo della parete, o porzione di parete, coinvolta nel cinematismo e più in particolare i vincoli la cui assenza o carenza predispone all'attivazione del meccanismo e per i quali occorre una verifica sull'edificio rivolta alla valutazione dell'esistenza e dell'efficacia;
- Carenze e vulnerabilità associate al meccanismo: sono segnalate le principali carenze costruttive e tecnologiche, da cui tra l'altro dipendono strettamente le condizioni di vincolo ipotizzabili per i corpi coinvolti nel cinematismo, e le vulnerabilità specifiche la cui esistenza nell'edificio è indicativa della possibilità di attivazione del meccanismo trattato;
- Sintomi che manifestano l'avvenuta attivazione del meccanismo: sono individuate le condizioni di danneggiamento e dissesto che più frequentemente si associano all'avvenuta attivazione del meccanismo e che consentono, qualora vengano rilevate, di ipotizzare le modalità di collasso di edifici già colpiti da un sisma;
- Differenti varianti del meccanismo: in relazione alle diverse caratteristiche costruttive degli edifici, sono specificate le varie modalità con cui il meccanismo considerato può manifestarsi dando luogo a differenti configurazioni dei corpi coinvolti nel cinematismo di collasso.

Per ogni meccanismo dev'essere valutato il moltiplicatore orizzontale dei carichi agenti sugli elementi strutturali $\alpha = \alpha_0$, rapporto tra le forze orizzontali applicate ed i corrispondenti pesi delle masse presenti, che porta all'attivazione dei cinematismi di collasso locali considerati, a partire dalla conoscenza delle grandezze coinvolte nell'analisi. Per una più agevole lettura delle formulazioni, di seguito si riassumono i simboli in esse utilizzati più frequentemente con l'indicazione del principale significato ad essi attribuito:

- α è il moltiplicatore orizzontale dei carichi agenti sui macroelementi;

- n è il numero di piani interessati dal cinematisismo;
- W_i è il peso proprio della parete al piano i -esimo o del macroelemento i -esimo;
- W_{oi} è il peso proprio della porzione del cuneo di distacco al piano i -esimo nelle pareti di controvento (comprensivo di eventuali carichi trasmessi da archi o volte su di esso agenti);
- F_{vi} è la componente verticale della spinta di archi o volte sulla parete al piano i -esimo;
- F_{hi} è la componente orizzontale della spinta di archi o volte sulla parete al piano i -esimo;
- P_{si} è il peso del solaio agente sulla parete al piano i -esimo;
- P_{soi} è il peso del solaio agente sulla porzione di cuneo al piano i -esimo nelle pareti di controvento;
- P_{vij} rappresenta l' i -esimo carico verticale trasmesso in testa al macroelemento j -esimo;
- P è il carico trasmesso dalla trave di colmo oppure dal puntone del tetto a padiglione;
- N è il generico carico verticale agente in testa al macroelemento;
- H rappresenta il valore massimo della reazione sopportabile dalla parete di controvento o dall'eventuale tirante alla spinta dell'effetto arco orizzontale nello spessore della facciata;
- P_H rappresenta la spinta statica trasmessa dalla copertura in testa al macroelemento;
- P_{Hij} è l' i -esima componente di spinta statica trasmessa dalla copertura in testa al corpo j -esimo;
- T_i rappresenta l'azione dei tiranti eventualmente presenti in testa alla parete del piano i -esimo;
- s_i è lo spessore della parete al piano i -esimo;
- h_i è il braccio verticale dell'azione trasmessa dal solaio e/o dal tirante alla parete al piano i -esimo oppure è l'altezza del macroelemento i -esimo;
- h_{pi} è il braccio verticale dell'azione trasmessa dal solaio alla parete al piano i -esimo;
- L_i è la lunghezza del macroelemento i -esimo;
- x_{Gi} è il braccio orizzontale del peso proprio del corpo i -esimo;
- y_{Gi} è il braccio verticale del peso proprio del corpo i -esimo;

- x_{GOi} è il braccio orizzontale del peso proprio della porzione del cuneo di distacco al piano i-esimo nelle pareti di controvento;
- y_{GOi} è il braccio verticale del peso proprio della porzione del cuneo di distacco al piano i-esimo nelle pareti di controvento;
- d è il braccio orizzontale del generico carico verticale trasmesso in testa al macroelemento;
- d_i è il braccio orizzontale del carico trasmesso dal solaio sulla parete al piano i-esimo;
- d_{ij} è il braccio orizzontale dell'i-esimo carico verticale applicato in testa al corpo j-esimo;
- d_{oi} è il braccio orizzontale del carico trasmesso dal solaio al cuneo di distacco nelle pareti di controvento;
- a_i è il braccio orizzontale del carico trasmesso dal solaio sulla parete al piano i-esimo;
- h_{vi} è il braccio verticale della spinta di archi o volte al piano i-esimo;
- d_{vi} è il braccio orizzontale delle azioni trasmesse da archi o volte al piano i-esimo.

Si osserva che i bracci delle diverse azioni considerate agenti sui macroelementi sono riferiti alle cerniere rispetto alle quali avviene la rotazione del relativo corpo rigido. Inoltre, con riferimento ai meccanismi che interessano pareti a doppia cortina, i simboli accompagnati dai pedici A e B indicano grandezze riferite rispettivamente alla cortina esterna ed interna.

Nel caso specifico, la compagine muraria è priva di sistemi di ritenuta e di sovraccarichi di impalcati. Pertanto, sulla base di quanto esaustivamente esposto si considererà il solo meccanismo di ribaltamento semplice (figura 36), per il quale è possibile sintetizzare le seguenti caratteristiche principali:

Condizioni di vincolo della parete interessata dal meccanismo:

- Assenza di vincolo in sommità;
- Assenza di collegamento alle pareti ortogonali.

Carenze e vulnerabilità associate al meccanismo:

- Assenza di cordoli o catene ai piani;
- Intersezioni murarie di cattiva qualità;
- Muratura a sacco o paramenti mal collegati.

Sintomi che manifestano l'avvenuta attivazione del meccanismo

- Lesioni verticali in corrispondenza delle intersezioni murarie (angolate e martelli murari);
- Fuori piombo della parete ribaltante;
- L'intero spessore del muro o il solo paramento esterno, in relazione alle caratteristiche della struttura muraria (a sacco, carenza di diatoni);
- Diverse geometrie della parete, in relazione alla presenza di discontinuità o di aperture.

Lo schema strutturale da considerare per la verifica a ribaltamento è riportato nella seguente figura.

Figura 32. *Meccanismo di ribaltamento semplice di una parete.*

Il calcolo del moltiplicatore si calcolò in accordo alle seguenti formulazione:

Momento stabilizzante:

$$M_S = \sum_{i=1}^n W_i \cdot \frac{S_i}{2} + \sum_{i=1}^n F_{Vi} \cdot d_{Vi} + \sum_{i=1}^n P_{Si} \cdot d_i + \sum_{i=1}^n T_i \cdot h_i$$

Momento ribaltante:

$$M_R = \alpha \cdot \left[\sum_{i=1}^n W_i \cdot y_{Gi} + \sum_{i=1}^n F_{Vi} \cdot h_{Vi} + \sum_{i=1}^n P_{Si} \cdot h_i \right] + \sum_{i=1}^n F_{Hi} \cdot h_{Vi} + P_H \cdot h_i$$

Moltiplicatore di collasso:

$$\alpha = \frac{\sum_{i=1}^n W_i \cdot \frac{S_i}{2} + \sum_{i=1}^n F_{Vi} \cdot d_{Vi} + \sum_{i=1}^n P_{Si} \cdot d_i + \sum_{i=1}^n T_i \cdot h_i - \sum_{i=1}^n F_{Hi} \cdot h_{Vi} - P_H \cdot h_i}{\sum_{i=1}^n W_i \cdot y_{Gi} + \sum_{i=1}^n F_{Vi} \cdot h_{Vi} + \sum_{i=1}^n P_{Si} \cdot h_i}$$

La verifica è stata eseguita su 8 diversi paramenti murari individuati in figura 33. La scelta è stata influenzata dalla geometria delle murature ed in particolare dall'altezza e dallo spessore.

Figura 33. Individuazione dei paramenti murari oggetto di verifica.

Di seguito si riportano le verifiche con il relativo esito per ogni paramento murario oggetto di analisi; le verifiche risultano soddisfatte.

Verifica paramento murario	ID	1	2	3	4	5	6	7	8
Peso specifico muratura	γ_M [kN/m ³]	19	19	19	19	19	19	19	19

7. CONCLUSIONI

Sulla base di quanto esaurientemente trattato nella presente relazione di calcolo, i resti della Chiesa di Santa Maria ad Nives nei pressi del Comune di Sant'Elia a Pianisi (CB), risultano verificati a valle della strategia di intervento proposta, in accordo a quanto prestabilito nel quadro normativo vigente.

PREMESSA

La presente relazione di calcolo riguarda le opere strutturali relative agli interventi restauro, consolidamento e conservazione presso il sito archeologico nei pressi del Comune di Sant'Elia a Pianisi, provincia di Campobasso.

Nello specifico, le opere in progetto sono sinteticamente riportate nel seguito:

- Rimozione della vegetazione e trattamento protettivo: insieme sistematico di opere atte a rimuovere la vegetazione presente e prevenirne lo sviluppo futuro (per ulteriori info si veda descrizione 1 della tavola 14 allegata);
- Protezione delle creste murarie: previa pulizia delle superfici interessate si prevede la stuccatura di eventuali fessure e riempimento di eventuali cavità con malta di calce idraulica compatibile con l'esistente. Successivamente si provvede alla protezione della cresta muraria con un layer di pietrame (per ulteriori specifiche si veda punto 2 della tavola 14);
- Cucitura della muratura mediante sistema composito in fibra di basalto e matrice inorganica: al fine di garantire il comportamento monolitico del sistema murario è prevista una ristilatura armata con materiale composito. La corda in fibra di basalto viene inserita tra i giunti di malta e tra i due paramenti, previa foratura, e con idoneo interasse. I giunti sono infine ristilati mediante malta a base di calce idraulica. Per ulteriori specifiche si veda il punto 3 della tavola 14, la relazione di calcolo strutturale e la relazione dei materiali allegata;
- Integrazione muraria dei paramenti murari: in corrispondenza delle mancanze rilevate nell'apparecchiatura muraria si provvede all'integrazione mediante materiale di reimpiego proveniente dallo scavo. Per ulteriori informazioni si veda la scheda 4 della tavola 14 allegata;
- Consolidamento dei conci di Pietrafavara: A seguito della rimozione della vegetazione superiore e della patina biologica, si prevede il consolidamento dei conci di Pietrafavara mediante applicazione a pennello di soluzione a base di silicato di etile. Si prevedono, inoltre, limitate rincoccature per colmare piccole mancanze o spazi al margine tra le parti in Pietrafavara e quelle in pietra calcarea. Per ulteriori informazioni si veda la scheda 5 della tavola 14 allegata;

- Sigillatura profonda dei giunti: si prevede la sigillatura in forte sottosquadro dei giunti, eseguita con malta a base di calce idraulica con composizione compatibile con quella preesistente, caratterizzata nel corso delle indagini preventivamente svolte. I giunti saranno rifiniti in forte sottosquadro rispetto ai conci e con profilo a scivolo per evitare l'accumulo di acque meteoriche. Per ulteriori informazioni si veda la scheda 6 della tavola 14 allegata;
- Colatura di malta a rifiuto: l'intervento, da realizzarsi dove il crollo del paramento esterno ha messo in luce il sacco della muratura, ha l'obiettivo di colmare vuoti discontinuità interne e assicurare una maggiore resistenza e una migliore ripartizione dei carichi. Per ulteriori specifiche si veda la scheda 7 della tavola 14;
- Rimozione del materiale di crollo e di scavo: Si prevede la ricognizione del materiale sciolto derivante da crolli o da precedenti scavi. Eventuali conci modanati o di reimpiego saranno catalogati e conservati. Si valuterà la possibilità di reimpiegare i restanti conci per interventi di reintegrazione del sacco della muratura e di protezione delle creste murarie. Per ulteriori info si rimanda alla scheda 8 della tavola 14 allegata.

Infine è prevista la sostituzione/integrazione dell'esistente staccionata con una nuova con struttura principale in acciaio e rivestimento in legno. La configurazione della staccionata ricalca quella esistente ma tenendo conto dei livelli di sicurezza attuali. La struttura principale è costituita da piatti in acciaio ad 80mm×10mm rivestita in pino autoclavato. I profili sono tra loro sagomati e saldati ed ancorati al suolo (roccioso) mediante inghisaggi. Per ulteriori specifiche si veda la tavola 14 allegata.

1. INQUADRAMENTO NORMATIVO

La struttura in esame è stata verificata e consolidata in accordo alle attuali normative vigenti:

- Decreto del Ministero delle Infrastrutture del 17 gennaio 2018 NTC2018 - Normativa tecnica costruzioni NTC 2018;
- Circolare 21 gennaio 2019, n. 7 C.S.LL.PP. Istruzioni per l'applicazione dell'Aggiornamento delle "Norme tecniche per le costruzioni" di cui al decreto ministeriale 17 gennaio 2018;
- CNR-DT 215/2018. Istruzioni per la Progettazione, l'Esecuzione ed il Controllo di Interventi di Consolidamento Statico mediante l'utilizzo di Compositi Fibrorinforzati a Matrice Inorganica. CNR – Commissione di Studio per la Predisposizione e l'Analisi di Norme Tecniche relative alle costruzioni;
- D.P.C.M del 9 febbraio 2011 "Valutazione e riduzione del rischio sismico del patrimonio culturale con riferimento alle norme tecniche per le costruzioni di cui al decreto ministeriale 14 gennaio 2008".
- Ordinanza Presidente del Consiglio dei Ministri n.3274 del 20.03.2003 - "Primi elementi in materia di criteri generali per la classificazione sismica del territorio nazionale e di normative tecniche per le costruzioni in zona sismica." e successive modifiche ed integrazioni;
- D.P.R. 6 giugno 2001, n. 380 – "Testo unico delle disposizioni legislative e regolamentari in materia edilizia Circ. n.11651 del14/02/1974";
- Legge 2 febbraio 1974 n. 64 – "Provvedimenti per le costruzioni con particolari prescrizioni per le zone sismiche";
- Linee Guida per la valutazione e riduzione del rischio sismico del patrimonio culturale, Ministero per i Beni e le Attività Culturali, Luglio 2006.

2. MATERIALI ESISTENTI

Per l'edificio/struttura in esame si è scelto di perseguire un livello di conoscenza LC1.

LC1: si intende raggiunto quando siano stati effettuati, come minimo, l'analisi storico-critica commisurata al livello considerato, con riferimento al § C8.5.1, il rilievo geometrico completo e indagini limitate sui dettagli costruttivi, con riferimento al § C8.5.2, prove limitate sulle caratteristiche meccaniche dei materiali, con riferimento al § C8.5.3; il corrispondente fattore di confidenza è $FC=1,35$ (nel caso di costruzioni di acciaio, se il livello di conoscenza non è LC2 solo a causa di una non estesa conoscenza sulle proprietà dei materiali, il fattore di confidenza può essere ridotto, giustificandolo con opportune considerazioni anche sulla base dell'epoca di costruzione).

Prove limitate: Si tratta di indagini non dettagliate e non estese, basate principalmente su esami visivi delle superfici, che prevedono limitati controlli degli elementi costituenti la muratura. Sono previste rimozioni locali dell'intonaco per identificare i materiali di cui è costituito l'edificio; in particolare, avvalendosi anche dell'analisi storico-critica, è possibile suddividere le pareti murarie in aree considerabili come omogenee. Scopo delle indagini è consentire l'identificazione delle tipologie di muratura alla quale fare riferimento ai fini della determinazione delle proprietà meccaniche; questo prevede il rilievo della tessitura muraria dei paramenti ed una stima della sezione muraria.

2.1.Muratura

Nel caso in cui la muratura in esame possa essere ricondotta alle tipologie murarie presenti nelle Tabelle C8.5.I e C8.5.II, i valori medi dei parametri meccanici da utilizzare per le verifiche possono essere definiti, con riferimento alla tipologia muraria in considerazione per i diversi livelli di conoscenza, come segue:

LC1: -Resistenze: i valori minimi degli intervalli riportati in Tabella C8.5.I.

- Moduli elastici: i valori medi degli intervalli riportati nella tabella suddetta.

Tabella C8.5.I -Valori di riferimento dei parametri meccanici della muratura, da usarsi nei criteri di resistenza di seguito specificati (comportamento a tempi brevi), e peso specifico medio per diverse tipologie di muratura. I valori si riferiscono a: f = resistenza media a compressione, τ_0 = resistenza media a taglio in assenza di tensioni normali (con riferimento alla formula riportata, a proposito dei modelli di capacità, nel §C8.7.1.3), f_{v0} = resistenza media a taglio in assenza di tensioni normali (con riferimento alla formula riportata, a proposito dei modelli di capacità, nel §C8.7.1.3), E = valore medio del modulo di elasticità normale, G = valore medio del modulo di elasticità tangenziale, w = peso specifico medio.

Tipologia di muratura	f (N/mm ²)	τ_0 (N/mm ²)	f_{v0} (N/mm ²)	E (N/mm ²)	G (N/mm ²)	w (kN/m ³)
	min-max	min-max		min-max	min-max	
Muratura in pietrame disordinata (ciottoli, pietre erratiche e irregolari)	1,0-2,0	0,018-0,032	-	690-1050 870	230-350 290	19
Muratura a conci sbazzati, con paramenti di spessore disomogeneo (*)	2,0	0,035-0,051	-	1020-1440	340-480	20
Muratura in pietre a spacco con buona tessitura	2,6-3,8	0,056-0,074	-	1500-1980	500-660	21
Muratura irregolare di pietra tenera (tufo, calcarenite, ecc.)	1,4-2,2	0,028-0,042	-	900-1260	300-420	13 ÷ 16(**)
Muratura a conci regolari di pietra tenera (tufo, calcarenite, ecc.) (**)	2,0-3,2	0,04-0,08	0,10-0,19	1200-1620	400-500	
Muratura a blocchi lapidei squadriati	5,8-8,2	0,09-0,12	0,18-0,28	2400-3300	800-1100	22
Muratura in mattoni pieni e malta di calce (***)	2,6-4,3	0,05-0,13	0,13-0,27	1200-1800	400-600	18
Muratura in mattoni semipieni con malta cementizia (es.; doppio UNI foratura ≤40%)	5,0-8,0	0,08-0,17	0,20-0,36	3500-5600	875-1400	15

(*) Nella muratura a conci sbazzati i valori di resistenza tabellati si possono incrementare se si riscontra la sistematica presenza di zeppe profonde in pietra che migliorano i contatti e aumentano l'ammorsamento tra gli elementi lapidei; in assenza di valutazioni più precise, si utilizzi un coefficiente pari a 1,2.

(**) Data la varietà litologica della pietra tenera, il peso specifico è molto variabile ma può essere facilmente stimato con prove dirette. Nel caso di muratura a conci regolari di pietra tenera, in presenza di una caratterizzazione diretta della resistenza a compressione degli elementi costituenti, la resistenza a compressione f_{pu} può essere valutata attraverso le indicazioni del § 11.10 delle NTC.

(***) Nella muratura a mattoni pieni è opportuno ridurre i valori tabellati nel caso di giunti con spessore superiore a 13 mm; in assenza di valutazioni più precise, si utilizzi un coefficiente riduttivo pari a 0,7 per le resistenze e 0,8 per i moduli elastici.

Le resistenze di progetto da impiegare, rispettivamente, per le verifiche a compressione, pressoflessione e a carichi concentrati (f_d), e a taglio (f_{vd}) valgono:

$$f_d = f_k / \gamma_M \quad [4.5.2]$$

$$f_{vd} = f_{vk} / \gamma_M \quad [4.5.3]$$

dove:

f_k è la resistenza caratteristica a compressione della muratura;

f_{vk} è la resistenza caratteristica a taglio della muratura in presenza delle effettive tensioni di compressione, valutata secondo quanto indicato al §11.10.3.3, in cui γ_M è il coefficiente parziale di sicurezza sulla resistenza a compressione della muratura, comprensivo delle incertezze di modello e di geometria, fornito dalla Tab. 4.5.II, in funzione delle classi di esecuzione più avanti precisate, e a seconda che gli elementi resistenti utilizzati siano di categoria I o di categoria II (vedi §11.10.1).

Tab. 4.5.II - *Valori del coefficiente γ_M in funzione della classe di esecuzione e della categoria degli elementi resistenti.*

Materiale	Classe di esecuzione	
	1	2
Muratura con elementi resistenti di categoria I, malta a prestazione garantita	2,0	2,5
Muratura con elementi resistenti di categoria I, malta a composizione prescritta	2,2	2,7
Muratura con elementi resistenti di categoria II, ogni tipo di malta	2,5	3,0

L'attribuzione delle Classi di esecuzione 1 e 2 viene effettuata adottando quanto di seguito indicato. In ogni caso occorre (Classe 2):

- disponibilità di specifico personale qualificato e con esperienza, dipendente dell'impresa esecutrice, per la supervisione del lavoro (capocantiere);
- disponibilità di specifico personale qualificato e con esperienza, indipendente dall'impresa esecutrice, per il controllo ispettivo del lavoro (direttore dei lavori).

La Classe 1 è attribuita qualora siano previsti, oltre ai controlli di cui sopra, le seguenti operazioni di controllo:

- controllo e valutazione in loco delle proprietà della malta e del calcestruzzo;
- dosaggio dei componenti della malta “a volume” con l'uso di opportuni contenitori di misura e controllo delle operazioni di miscelazione o uso di malta premiscelata certificata dal produttore.

Tabella 2. Caratteristiche meccaniche materiali esistenti.

2.1.1. Legame costitutivo della muratura

Date le caratteristiche della struttura in esame è stato adottato un legame elastico-lineare. Legami più complessi, oltre ad essere di difficile calibrazione per la muratura in esame, risulterebbero non conformi ai principi di conservazione e mantenimento dell'integrità dell'opera.

3. MATERIALI NUOVI

I materiali nuovi si riferiscono a quelli necessari alla strategia di intervento proposta.

3.1.Malta a base di calce idraulica per allettamenti e regolarizzazioni

La malta serve per la stilatura e l'allettamento traspiranti di murature portanti e di tamponamento “faccia a vista” in pietra, mattoni, tufo e miste, anche di pregio storico ed artistico, all'interno e all'esterno.

Malta premiscelata in polvere da muratura, esente da cemento, composta da calce idraulica naturale ed Eco-Pozzolana, sabbie naturali, speciali additivi e microfibre. In base alla norma EN 998-2, il prodotto è classificabile come G: “Malta da muratura a prestazione garantita per scopi generali per l'utilizzo esterno in elementi soggetti a requisiti strutturali”, di Classe M 5, in quanto raggiunge una resistenza a compressione $> 5 \text{ N/mm}^2$. La malta possiede un ritiro igrometrico bassissimo che riduce in modo drastico il rischio di comparsa di fessure sulla malta. Inoltre presenta delle proprietà che rendono il prodotto resistente alle diverse aggressioni chimico-fisiche come, ad esempio, ai sali solubili, ai cicli di gelo-disgelo, all'azione dilavante delle acque piovane ed alla reazione alcali-aggregato.

Nella tabella dei dati tecnici (nelle sezioni Dati Applicativi e Prestazioni Finali) sono riportati alcuni valori tipici, legati alle principali caratteristiche sia allo stato fresco che indurito di tali malte.

Di seguito sono riportati i requisiti prestazionali della malta.

Tipo di malta (EN 998-2):	G - Malta da muratura a prestazione garantita per scopi generali per l'utilizzo esterno in elementi soggetti a requisiti strutturali
Aspetto:	polvere

Tipo di legante (EN 459-1):	NHL 3,5 e NHL 5	
Dimensione massima dell'aggregato (EN 1015-1) (mm):	1,5	
Massa volumica apparente (kg/m ³):	1.500	
Contenuto di cloruri (EN 1015-17) (%):	Requisiti in accordo alla EN 998-2	Prestazione prodotto
	< 0,1	< 0,05

Aspetto dell'impasto:	tissotropico
Consistenza della malta fresca (EN 1015-3) (mm):	175
Massa volumica apparente della malta fresca (EN 1015-6) (kg/m ³):	1.950
Porosità della malta allo stato fresco (EN 1015-7) (%):	6
Temperatura di applicazione permessa:	da +5°C a +35°C
Tempo di lavorabilità della malta fresca (EN 1015-9):	ca. 60 min.
Spessore minimo applicabile (mm):	5
Spessore massimo applicabile per strato (mm):	30

PRESTAZIONI FINALI (acqua d'impasto 19%)			
Caratteristica prestazionale	Metododi prova	Requisiti in accordo alla EN 998-2	Prestazione prodotto
Resistenza a compressione a 28 gg (N/mm ²):	EN 1015-11	da Classe M 1 (> 1 N/mm ²) a Classe M 4 (> 25 N/mm ²)	Classe M 5
Adesione al supporto (N/mm ²):	EN 1015-12	non richiesto	≥ 0,5 Modo di rottura (FP) = B
Resistenza iniziale a taglio (N/mm ²):	EN 998-2 Appendice C	valore tabulato	0,15
Assorbimento d'acqua per capillarità [kg/(m ² ·min ^{0,5})]:	EN 1015-18	valore dichiarato	< 0,3
Coefficiente di permeabilità al vapore acqueo (μ)	EN 1015-19	valore tabulato	15/35
Conducibilità termica (λ _{10,dry}) (W/m·K):	EN 1745	valore tabulato	0,77

Reazione al fuoco:	EN 13501-1	valore dichiarato dal produttore	Classe A1
Resistenza ai solfati (%):	ASTM C 1012 mod.	non richiesto	< 0,02
Efflorescenze saline: (dopo semi-immersione in acqua)	/	non richiesto	assenti

3.2. Malta a base di calce idraulica per cucitura armata

Per la ristilatura armata si prevede l'utilizzo di una malta premiscelata fibrorinforzata a elevata duttilità composta da calce idraulica naturale (NHL) ed Eco-pozzolana, particolarmente indicata per la regolarizzazione di superfici in

pietra, mattoni e tufo e per il rinforzo strutturale di paramenti esistenti anche senza l'ausilio di reti di rinforzo.

La malta (mono o bicomponente) premiscelata è composta da calce idraulica naturale (NHL) ed Eco-Pozzolana, sabbie naturali, additivi speciali e polimeri sintetici in dispersione acquosa. La malta è classificabile, secondo la normativa europea EN 998-2, come malta da muratura di tipo M15 e in base alla norma EN 998-1 come intonaco tipo GP categoria CS IV, in quanto raggiunge una resistenza meccanica a compressione $> 15 \text{ N/mm}^2$ (UNI EN 1015-11), pur essendo una malta composta da calce ed Eco-Pozzolana.

Di seguito si riportano le specifiche principali.

Aspetto:	polvere
Colore:	chiaro
Massa volumica apparente (kg/m^3):	1.400
Diametro massimo aggregato (mm):	1,5
Contenuti di cloruri (EN 1015-17) (%) (requisito minimo: $\leq 0,05\%$):	$< 0,05$

Consistenza dell'impasto:	fluida-spatolabile
Massa volumica dell'impasto (kg/m^3):	1.800
Spessore di applicazione (mm):	circa 5 mm per mano
Temperatura di applicazione permessa:	da $+5^\circ\text{C}$ a $+35^\circ\text{C}$
Durata dell'impasto (a $+20^\circ\text{C}$):	ca. 1 h
Tempo di presa (inizio-fine):	10 h / 20 h

Caratteristica prestazionale	Metodo di prova	Requisiti in accordo alla EN 998-1	Requisiti in accordo alla EN 998-2	Prestazione prodotto
Resistenza a compressione a 28 gg (N/mm^2):	EN 1015-11	CS I (da 0,4 a 2,5)	da Classe M ($> 1 \text{ N/mm}^2$) a Classe M d ($d \geq 25 \text{ N/mm}^2$ o multipli di 5)	> 15 (Categoria CS IV) (Classe M15)
		CS II (da 1,5 a 5,0)		
		CS III (da 3,5 a 7,5)		
		CS IV (≥ 6)		
Adesione al supporto (N/mm^2):	EN 1015-12	valore dichiarato a modo di rottura (FP)	non richiesto	$\geq 0,8$ Modo di rottura (FP) = B

Resistenza iniziale a taglio (N/mm ²):	EN 1052-3	non richiesto	valore tabulato	0,15
Modulo elastico a compressione (GPa):	EN 13412	non richiesto	non richiesto	8,000
Assorbimento d'acqua per capillarità [kg/(m ² ·min ^{0,5})]:	EN 1015-18	W _c 0 non specificato W _c 1 ≤ 0,40 W _c 2 ≤ 0,20	valore dichiarato	Categoria W _c 2 ≤ 0,2
Coefficiente di permeabilità al vapore acqueo (μ):	EN 1015-19	valore dichiarato	–	≤ 60
Conducibilità termica (λ _{10,dry}) (W/m·K):	EN 1745	valore tabulato	valore tabulato	0,66 (P = 50%)
Reazione al fuoco:	EN 13501-1	Euroclasse	Euroclasse	A2, s1 - d0

Massa volumica dell'impasto (kg/m ³):	1.800
Spessore di applicazione (mm):	circa 5 mm per mano
Temperatura di applicazione permessa:	da +5°C a +35°C
Durata dell'impasto:	ca. 1 h (a +20°C)
Resistenza a compressione 28 gg (UNI EN 1015-11) (N/mm ²):	> 15
Resistenza a taglio iniziale (N/mm ²):	0,15
Modulo elastico a compressione (UNI EN 13412) (GPa):	8,000
Adesione al supporto 28 gg (UNI EN 1015-12) (N/mm ²):	≥ 0,8

3.3.Fibra di basalto

La fibra di basalto è un materiale artificiale composto da fibre sottili. Nel caso specifico si adotta sottoforma di trefoli/cordini di diametro medio di circa 3 mm. Sono fibre naturali, quindi hanno un'impronta ecologica molto ridotta. Resistenza al fuoco e alte temperature uniche. Eccellente resistenza meccanica. Elevata resistenza chimica.

Di seguito si riportano le specifiche principali di tale componente:

Tipo di fibra	Basalto
Modulo elastico medio (GPa)	≥60
Allungamento a rottura (%)	≥1.5
Resistenza a trazione (MPa)	≥1100

3.3.1. Legame costitutivo composito

In accordo a quanto specificato nel quadro normativo vigente il composito è stato modellato trascurando il contributo della matrice. Pertanto, è stato considerato un comportamento elastico lineare della sola fibra.

3.4. Legno

Il legno di pino autoclavato rappresenta la soluzione ottimale per l'utilizzo esterno. Il trattamento in autoclave con sali privi di cromo rende il legno resistente all'azione degli agenti atmosferici con il passare del tempo. Questo consente di impiegare all'esterno tale prodotto garantendo una buona longevità. Date le finalità di utilizzo non sono richieste particolari classi di resistenza dello stesso. Si riportano in seguito le specifiche tipiche di tale tipologia.

		Pino Italia
		S2
Resistenze [MPa]		
Flessione	$f_{m,k}$	22
Trazione parallela	$f_{t,0,k}$	13
Trazione perpendicolare	$f_{t,90,k}$	0.4
Compressione parallela	$f_{c,0,k}$	20
Compressione perpendicolare	$f_{c,90,k}$	3.0
Taglio	$f_{v,k}$	3.8
Rigidezze [GPa]		
Modulo di elasticità parallelo medio	$E_{0,mean}$	12.0
Modulo di elasticità parallelo 5-percentile	$E_{0,05}$	8.0
Modulo di elasticità perpendicolare medio	$E_{90,mean}$	0.40
Modulo di taglio medio	G_{mean}	0.75
Massa volumica [kg/m ³]		
Massa volumica caratteristica	ρ_k	425
Massa volumica media	ρ_{mean}	520
(1) Massima altezza e larghezza 100mm.		

3.5. Acciaio per carpenteria

Per la realizzazione della nuova staccionata è stata adottata una classe di resistenza S235 (§ 4.2.1.1 della NTC18) inerente a elementi laminati a caldo con profili a sezione aperta piani e lunghi, aventi spessore nominale minore o uguale a 40 mm, coerentemente con quanto riportato nella Normativa Tecnica vigente NTC18.

Le caratteristiche meccaniche dell'acciaio impiegato sono di seguito riportate:

Classe di resistenza	S235 (UNI EN 10025-2)
Tensione di snervamento	$f_{yk} = 235 \text{ MPa}$
Tensione di rottura	$f_{tk} = 360 \text{ MPa}$
Modulo elastico	$E = 210\,000 \text{ MPa}$

Tabella 3: Caratteristiche meccaniche dell'acciaio per carpenteria metallica

Classe di resistenza	4.8 (UNI EN ISO 898-1:2013)
Tensione di snervamento	$f_{yb} = 320 \text{ MPa}$
Tensione di rottura	$f_{tb} = 400 \text{ MPa}$

Tabella 4: Caratteristiche meccaniche dei bulloni per la copertura

Tipo	a cordoni d'angolo (UNI EN ISO 4063:2011)
Classe	2
Elettrodi	UNI EN ISO 2560

Tabella 5: Caratteristiche meccaniche della saldatura

3.5.1. Legame costitutivo composito

Per il legame costitutivo dell'acciaio è possibile far riferimento al modello elastico-perfettamente plastico disciplinato dall'attuale normativa vigente, nel quale, i valori di primo snervamento e rottura sono stati fissati in accordo alla classe di resistenza dell'acciaio.

Inoltre, per il diagramma tensione-deformazione dell'acciaio è possibile adottare opportuni modelli più rappresentativi del reale comportamento del materiale, modelli definiti in base al valore di snervamento e del rapporto di incrudimento (elastico-incrudente).

In figura seguente sono rappresentati i due modelli tipicamente adottati per l'acciaio:

- (a) bilineare finito con incrudimento;
- (b) elastico-perfettamente plastico indefinito.

Nel caso specifico, è stato adottato, per gli elementi della staccionata un comportamento al limite elastico in ipotesi di sezioni di classe 3

4. CONCLUSIONI

Gli interventi di rinforzo sono stati progettati rispettando i requisiti di compatibilità dei nuovi materiali con quelli esistenti.

1. PREMESSA

Nella presente relazione si riportano alcuni controlli effettuati per verificare l'attendibilità dei risultati forniti dal software impiegato. Infatti, al capitolo 10 delle NTC18, è specificato che spetta al progettista il compito di sottoporre i risultati a controlli che ne comprovino l'attendibilità.

2. QUADRO NORMATIVO DI RIFERIMENTO

Il presente documento è stato sviluppato sulla base di quanto specificato nel seguente quadro normativo:

- NTC18, D.M. del 17 gennaio 2018 - “Aggiornamento delle «Norme tecniche per le costruzioni»”;
- Circolare n. 7 C.S.LL.PP. del 21 gennaio 2019 - “Istruzioni per l'applicazione dell'«Aggiornamento delle “Norme tecniche per le costruzioni”» di cui al decreto ministeriale 17 gennaio 2018”.

3. TIPO DI ANALISI SVOLTA

L'analisi strutturale e le verifiche sono condotte con l'ausilio di un codice di calcolo automatico.

La verifica della sicurezza degli elementi strutturali avviene con i metodi della scienza delle costruzioni.

L'analisi strutturale è condotta con l'analisi statica lineare utilizzando il metodo degli spostamenti per la valutazione dello stato tenso-deformativo indotto da carichi statici. L'analisi strutturale sotto le azioni sismiche è condotta con il metodo dell'analisi statica lineare, dinamica modale e dello spettro di risposta in termini di accelerazione secondo le disposizioni dei capitoli 3 e 7 delle NTC2018.

L'analisi strutturale viene effettuata con il metodo degli elementi finiti. Il metodo sopraindicato si basa sulla discretizzazione della struttura in elementi connessi solo in corrispondenza di un numero prefissato di punti denominati nodi. I nodi sono

definiti dalle tre coordinate cartesiane in un sistema di riferimento globale. Le incognite del problema (nell'ambito del metodo degli spostamenti) sono le componenti di spostamento dei nodi riferite al sistema di riferimento globale (traslazioni secondo X, Y, Z, rotazioni attorno X, Y, Z). La soluzione del problema si ottiene con un sistema di equazioni algebriche lineari i cui termini noti sono costituiti dai carichi agenti sulla struttura opportunamente concentrati ai nodi. La verifica degli elementi strutturali è eseguita con il metodo degli Stati Limite. Le combinazioni di carico adottate sono esaustive relativamente agli scenari di carico più gravosi cui l'opera sarà soggetta.

4. CODICI DI CALCOLO ED AFFIDABILITÀ

L'analisi è stata eseguita con il software PRO_SAP PROfessional Structural Analysis Program, prodotto dalla 2S.I. Software e Servizi per l'Ingegneria s.r.l., Via Garibaldi, 90, 44121, Ferrara (FE), Italia. In merito al punto 10.2 delle Norme Tecniche per le Costruzioni (Affidabilità dei codici utilizzati), si fa riferimento al Documento di Affidabilità "Test di validazione del software di calcolo PRO_SAP e dei moduli aggiuntivi PRO_SAP Modulo Geotecnico, PRO_CAD nodi acciaio e PRO_MST", il quale contiene un numero significativo di casi prova in cui i risultati dell'analisi numerica sono stati confrontati con soluzioni teoriche.

Dopo aver effettuato l'esame preliminare di valutazione dell'affidabilità e soprattutto dell'idoneità del programma nel caso specifico di applicazione, il programma di calcolo adottato è stato ritenuto idoneo per il caso specifico.

5. MODALITÀ DI PRESENTAZIONE DEI RISULTATI

La relazione di calcolo strutturale presenta i dati di calcolo tale da garantirne la leggibilità, la corretta interpretazione e la riproducibilità. In particolare la relazione di calcolo oltre a illustrare in modo esaustivo i dati in ingresso e i risultati delle analisi in forma tabellare, riporta una serie di immagini, almeno per le parti più

sollecitate della struttura, tale da avere una sintesi completa e efficace del comportamento della struttura per ogni tipo di analisi svolta.

6. INFORMAZIONI GENERALI SULL'ELEABORAZIONE

Il programma prevede una serie di controlli automatici (check) che consentono l'individuazione di errori di modellazione, del non rispetto delle limitazioni geometriche e di armatura e della presenza di elementi non verificati. Al termine dell'analisi un controllo automatico identifica la presenza di spostamenti o rotazioni abnormi. Il codice di calcolo consente di visualizzare e controllare, sia in forma grafica che tabulare, la quasi totalità dei dati del modello strutturale, in modo da avere una visione consapevole del comportamento corretto del modello strutturale.

7. VALIDAZIONE DEI CODICI DI CALCOLO

La struttura in progetto non è relativa ad un'opera di particolare complessità, per questo non sono stati eseguiti controlli incrociati sui risultati di calcolo, attraverso l'esecuzione nuovamente dei calcoli mediante programmi di calcolo diversi da quelli usati originariamente.

In ogni caso, si è proceduto a valutare manualmente l'analisi dei carichi, la massa sismica della struttura in oggetto e le tensioni interne.

I risultati ottenuti dal calcolo manuale e dal software di calcolo adottato sono simili e caratterizzati da una variazione trascurabile.

8. GIUDIZIO MOTIVATO DI ACCETTABILITÀ DEI RISULTATI

I risultati delle elaborazioni sono stati sottoposti a controlli che ne comprovano l'attendibilità.

Tale valutazione ha compreso il confronto con i risultati di semplici calcoli, eseguiti con metodi tradizionali e adottati, anche in fase di primo proporzionamento della struttura. Inoltre, sulla base di considerazioni riguardanti gli stati tensionali e deformativi determinati, si è valutata la validità delle scelte operate in sede di schematizzazione e di modellazione della struttura e delle azioni.

In base a quanto detto, si può asserire che l'elaborazione è corretta ed idonea al caso specifico, pertanto i risultati di calcolo sono da ritenersi validi ed accettabili.

Napoli, 12/09/2022
